Fruit weight
0.8-1.2 kg

Product cultivation

Disease resistance
IR: Px

Sowing period
April to May

Planting period
May to June

Harvest
Early August to late September

Cycle
Late

Additional information

Open ground direct sowing (minimum surface soil temperature 14-16°C), in seed trays directly or with transplanting, in soil blocks or pots using a moist but not soggy substrate. Germination temperature 23-25°C (2-3 days). Transplanting after cotyledon unfolding. Growing conditions: night 14-15°C min, day 16-20°C min.
Gradually aerate the nursery to ensure the seedlings don't get leggy and to harden them off before planting (e.g. by finishing growing them outdoors). Growing period: 10-15 days depending on the season and soil block size. Using seedlings results in an earlier harvest.

IMPORTANT : The descriptions, illustrations, photographs, advice, suggestions and vegetation cycles that may be presented herein are aimed at home gardeners exclusively and are derived from observations made in defined conditions on various trials. They are offered in all good faith, for purely informational purposes, and shall not therefore, under any circumstances, be held to be exhaustive, be taken as any form of guarantee of harvest or performance, prejudge specific factors or circumstances (either current or future), and more generally, form any kind of contractual undertaking whatsoever. The user must first and foremost ensure that his exploitation conditions, local geographical conditions, his planned growing period, his soil, the means at his disposal, his resources and his equipment, and more generally his agronomical, climatic, sanitary and environmental context are suitable for the crops, techniques and varieties that are presented herein.
